Encapsulation of ICMP packet

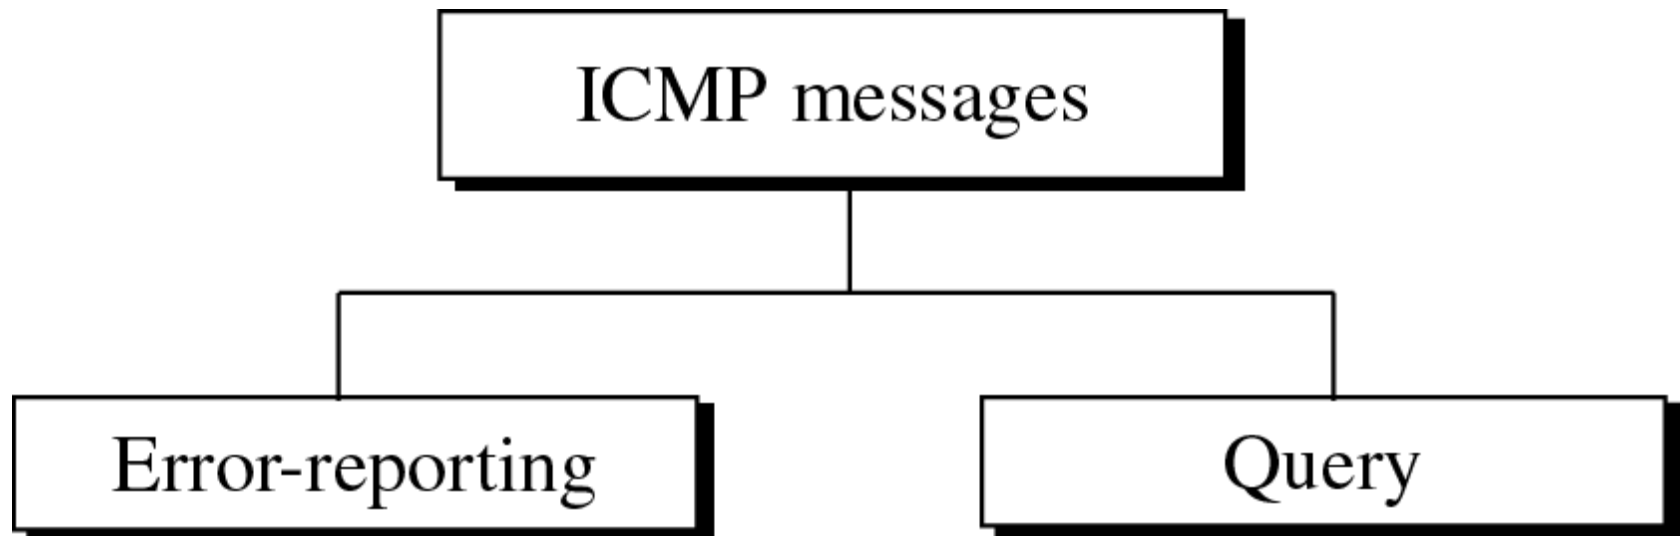

9.1

TYPES OF MESSAGES

Figure 9-3

ICMP messages

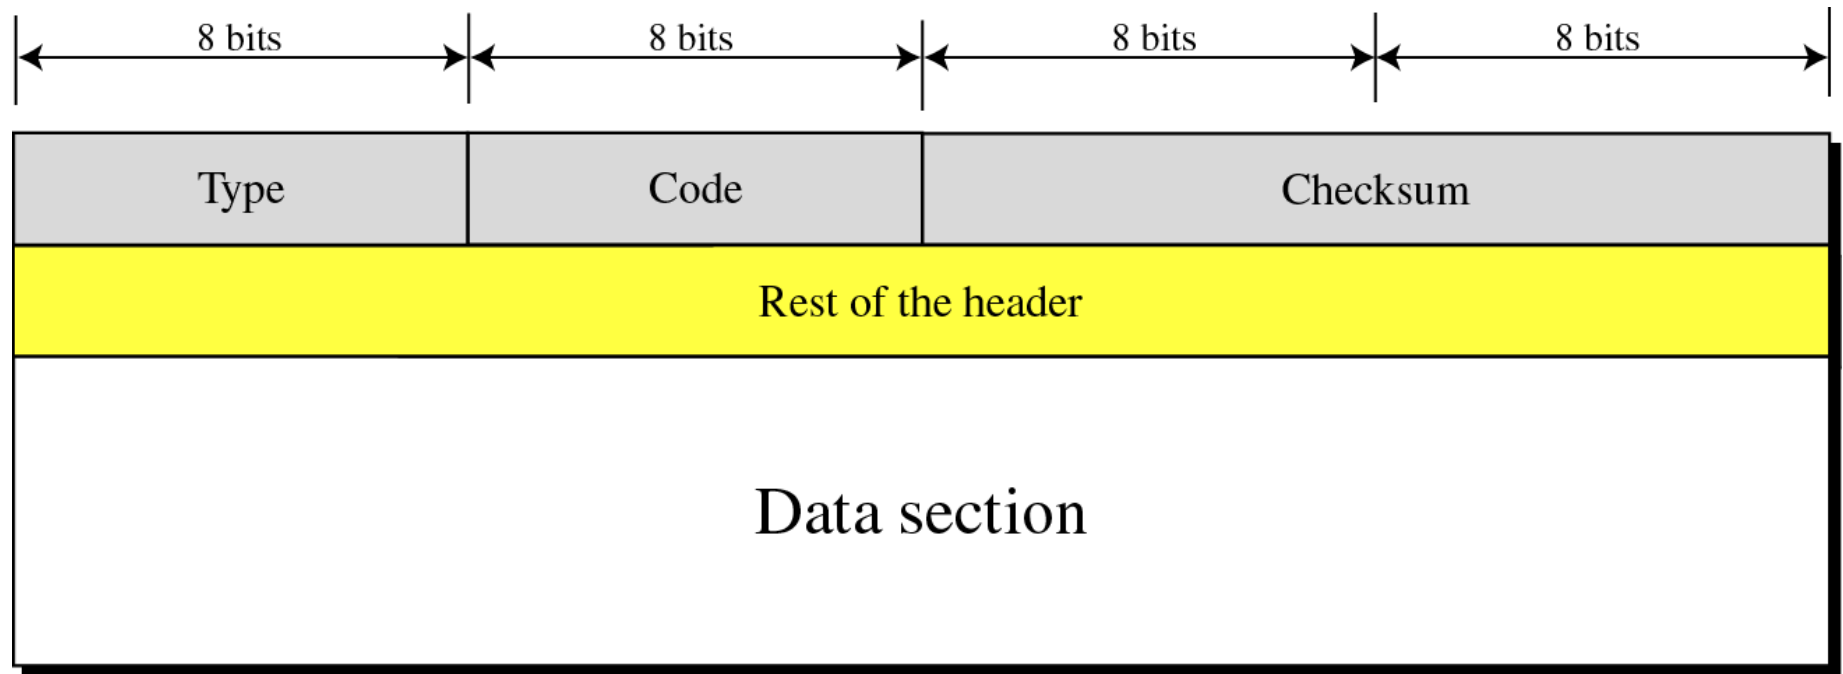

9.2

MESSAGE FORMAT

Figure 9-4

General format of ICMP messages

9.3

ERROR REPORTING

Note

*ICMP always reports
error messages
to the original source.*

Figure 9-5

Error-reporting messages

Note

Important points about ICMP error messages:

- 1. No ICMP error message for a datagram carrying an ICMP error message.*
- 2. No ICMP error message for a fragmented datagram that is not the first fragment.*
- 3. No ICMP error message for a datagram having a multicast address.*
- 4. No ICMP error message for a datagram with a special address such as 127.0.0.0 or 0.0.0.0.*

Figure 9-6

Contents of data field for error messages

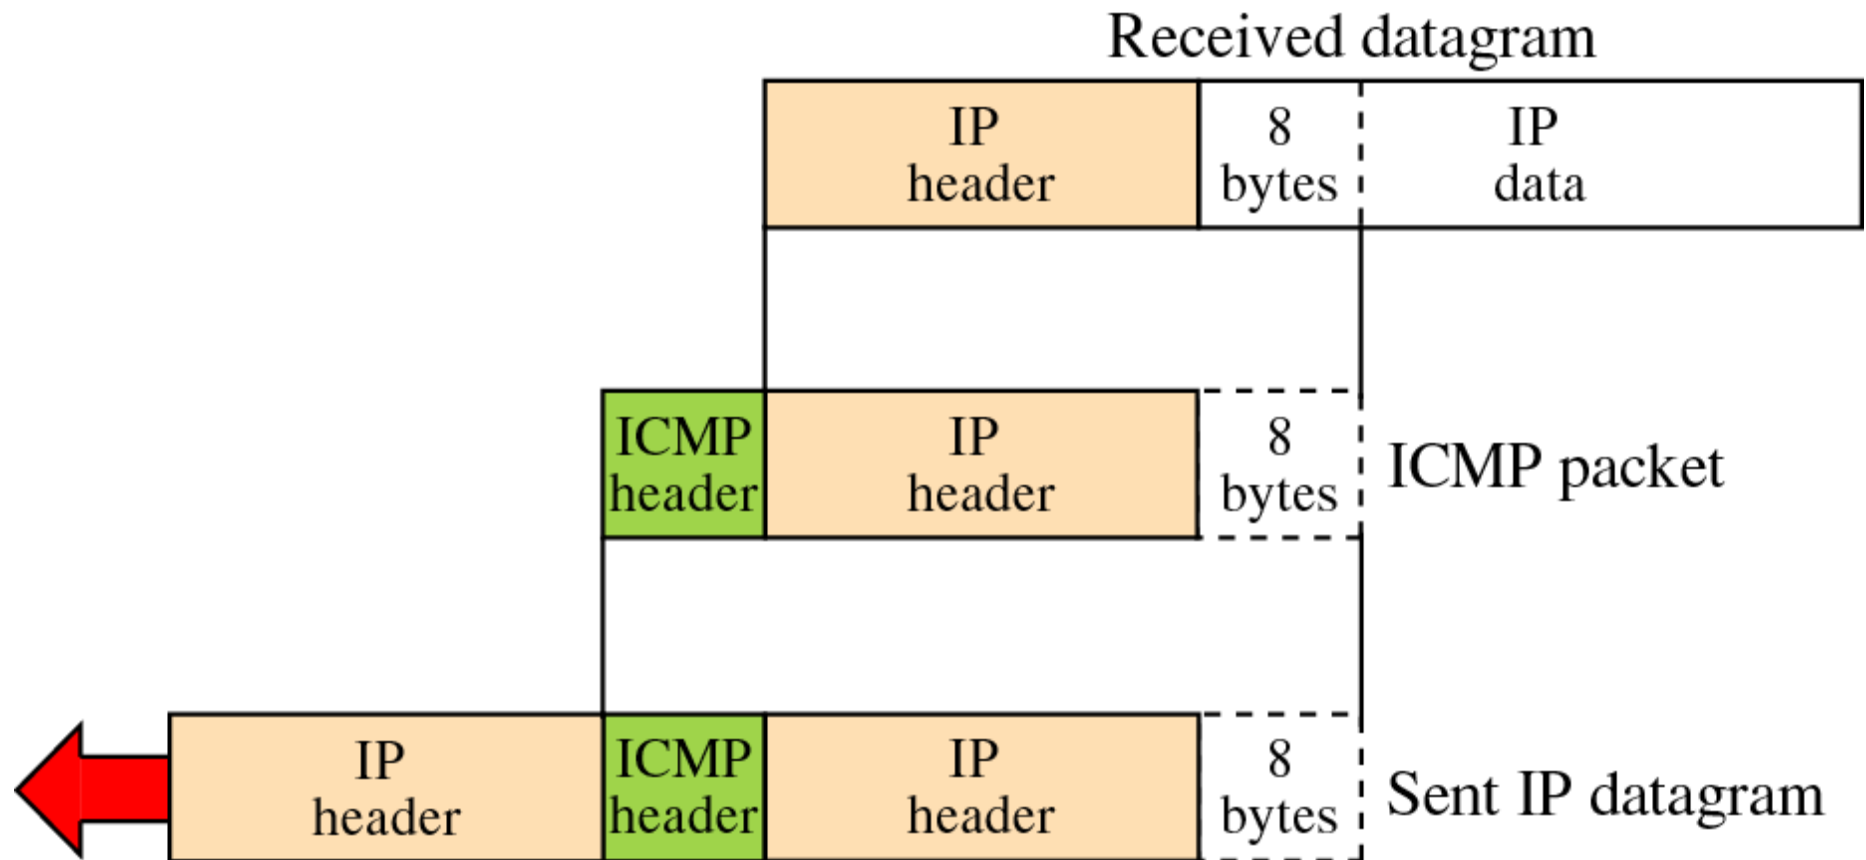

Figure 9-7

Destination-unreachable format

Type: 3	Code: 0 to 15	Checksum
Unused (All 0s)		
Part of the received IP datagram including IP header plus the first 8 bytes of datagram data		

Destination-unreachable different codes

- ☐ Code 0: the network is unreachable
- ☐ Code 1: the host is unreachable
- ☐ Code 2: the protocol is unreachable
- ☐ Code 3: the port is unreachable
- ☐ Code 4: fragmentation is required but the DF flag is set
- ☐ Code 5: source routing can not be accomplished
- ☐ Code 6: the destination network is unknown
- ☐ Code 7: the destination host is unknown
- ☐ Code 9: communication with destination network is administratively prohibited
- ☐ Code 10: communication with destination host is administratively prohibited
- ☐ Code 11: the network is unreachable for specified type of service
- ☐ Code 12: the host is unreachable for specified type of service
- ☐ Code 14: the host is unreachable because the precedence is violated
- ☐ Code 15: the host is unreachable because the precedence was cut off

Note

Destination-unreachable messages with codes 2 or 3 can be created only by the destination host.
Other destination-unreachable messages can be created only by routers.

Note

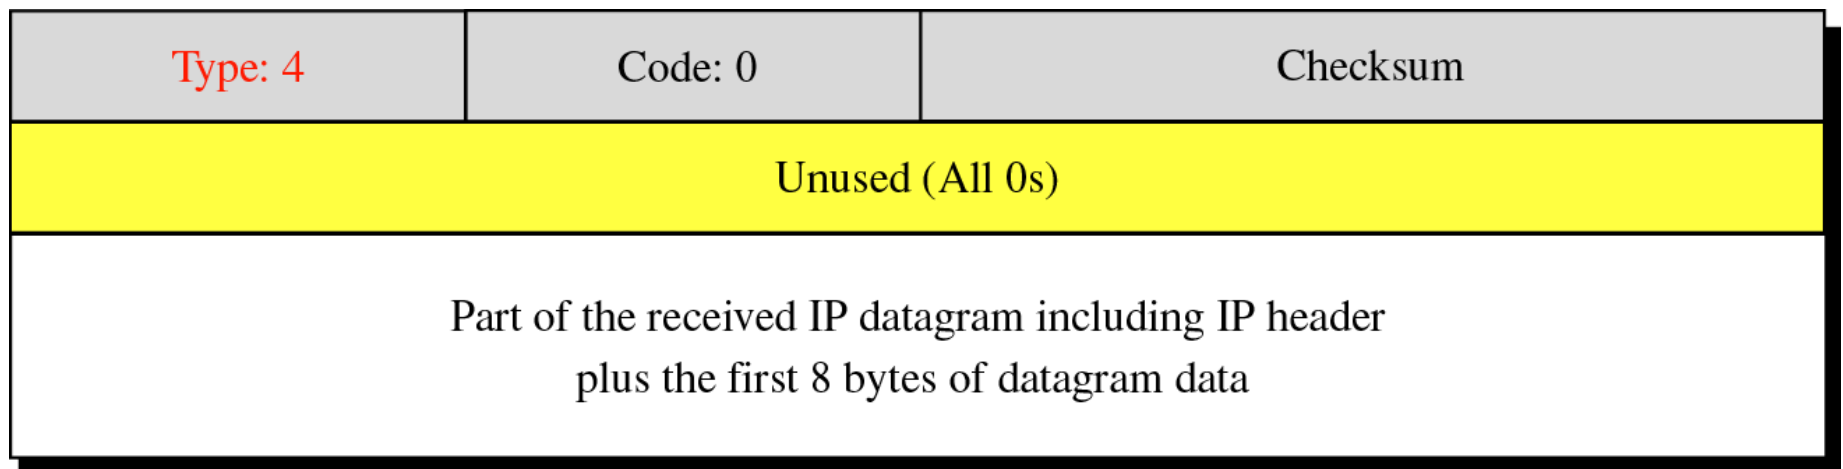

A router cannot detect all problems that prevent the delivery of a packet.

Note

*There is no flow-control mechanism
in the IP protocol.*

Figure 9-8

Source-quench format

Note

A source-quench message informs the source that a datagram has been discarded due to congestion in a router or the destination host.

The source must slow down the sending of datagrams until the congestion is relieved.

Note

One source-quench message should be sent for each datagram that is discarded due to congestion.

Note

Whenever a router receives a datagram with a time-to-live value of zero, it discards the datagram and sends a time-exceeded message to the original source.

Note

When the final destination does not receive all of the fragments in a set time, it discards the received fragments and sends a time-exceeded message to the original source.

Note

*In a time-exceeded message,
code 0 is used only by routers
to show that the value of
the time-to-live field is zero.
Code 1 is used only by the destination
host to show that not all of the
fragments have arrived within a set time.*

Figure 9-9

Time-exceeded message format

Type: 11	Code: 0 or 1	Checksum
Unused (All 0s)		
Part of the received IP datagram including IP header plus the first 8 bytes of datagram data		

Code 0: Time to live

Code 1: Fragmentation

Note

*A parameter-problem message can
be created by
a router or the destination host.*

Figure 9-10

Parameter-problem message format

Type: 12	Code: 0 or 1	Checksum
Pointer	Unused (All 0s)	
Part of the received IP datagram including IP header plus the first 8 bytes of datagram data		

Code 0: Main header problem

Code 1: Problem in the option field

Figure 9-11

Redirection concept

Note

*A host usually starts with a small routing table that is gradually augmented and updated.
One of the tools to accomplish this is the redirection message.*

Figure 9-12

Redirection message format

Type: 5	Code: 0 to 3	Checksum
IP address of the target router		
Part of the received IP datagram including IP header plus the first 8 bytes of datagram data		

Code 0: Network specific

Code 1: Host specific

Code 2: Network specific (specified service)

Code 3: Host specific (specified service)

Note

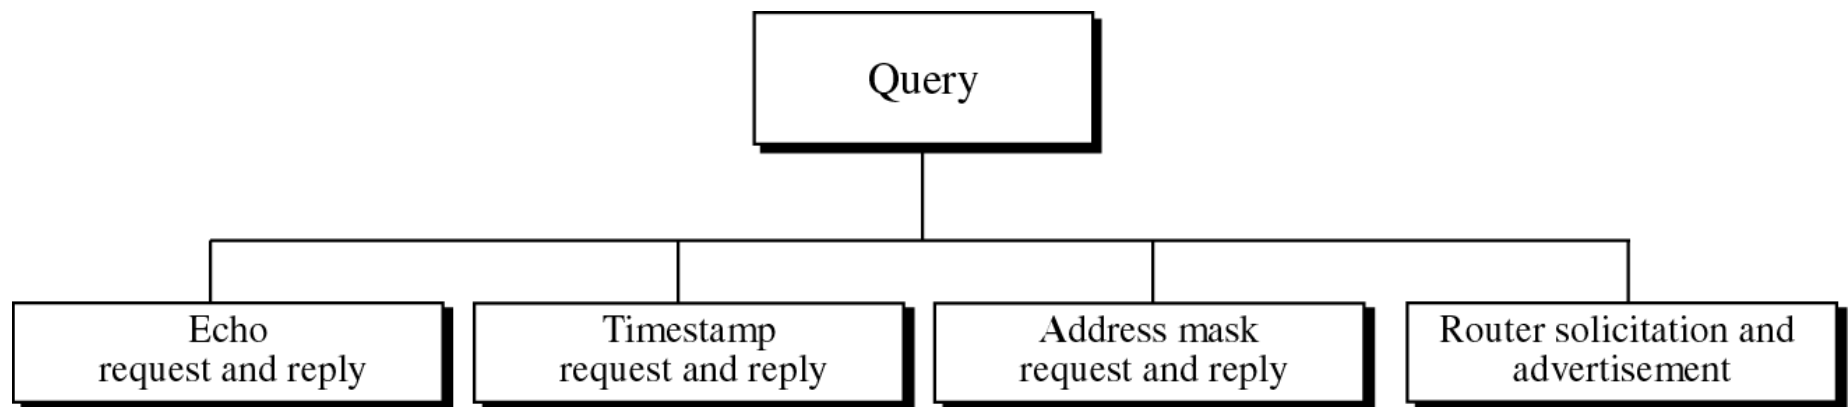

A redirection message is sent from a router to a host on the same local network.

9.4

QUERY

Figure 9-13

Query messages

Note

An echo-request message can be sent by a host or router.
An echo-reply message is sent by the host or router which receives an echo-request message.

Note

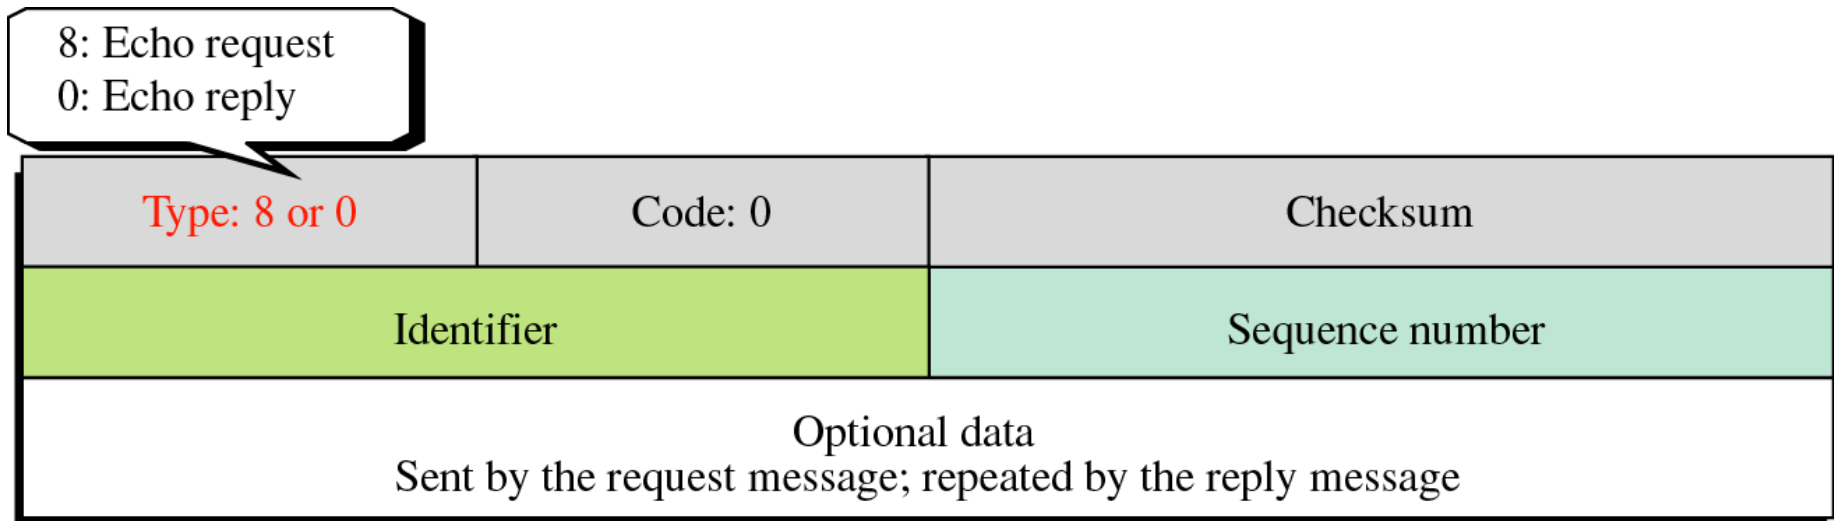

*Echo-request and echo-reply messages
can be used by network managers
to check the operation of the IP protocol.*

Note

*Echo-request and echo-reply messages
can test the
reachability of a host.
This is usually done by
invoking the **ping** command.*

Figure 9-14

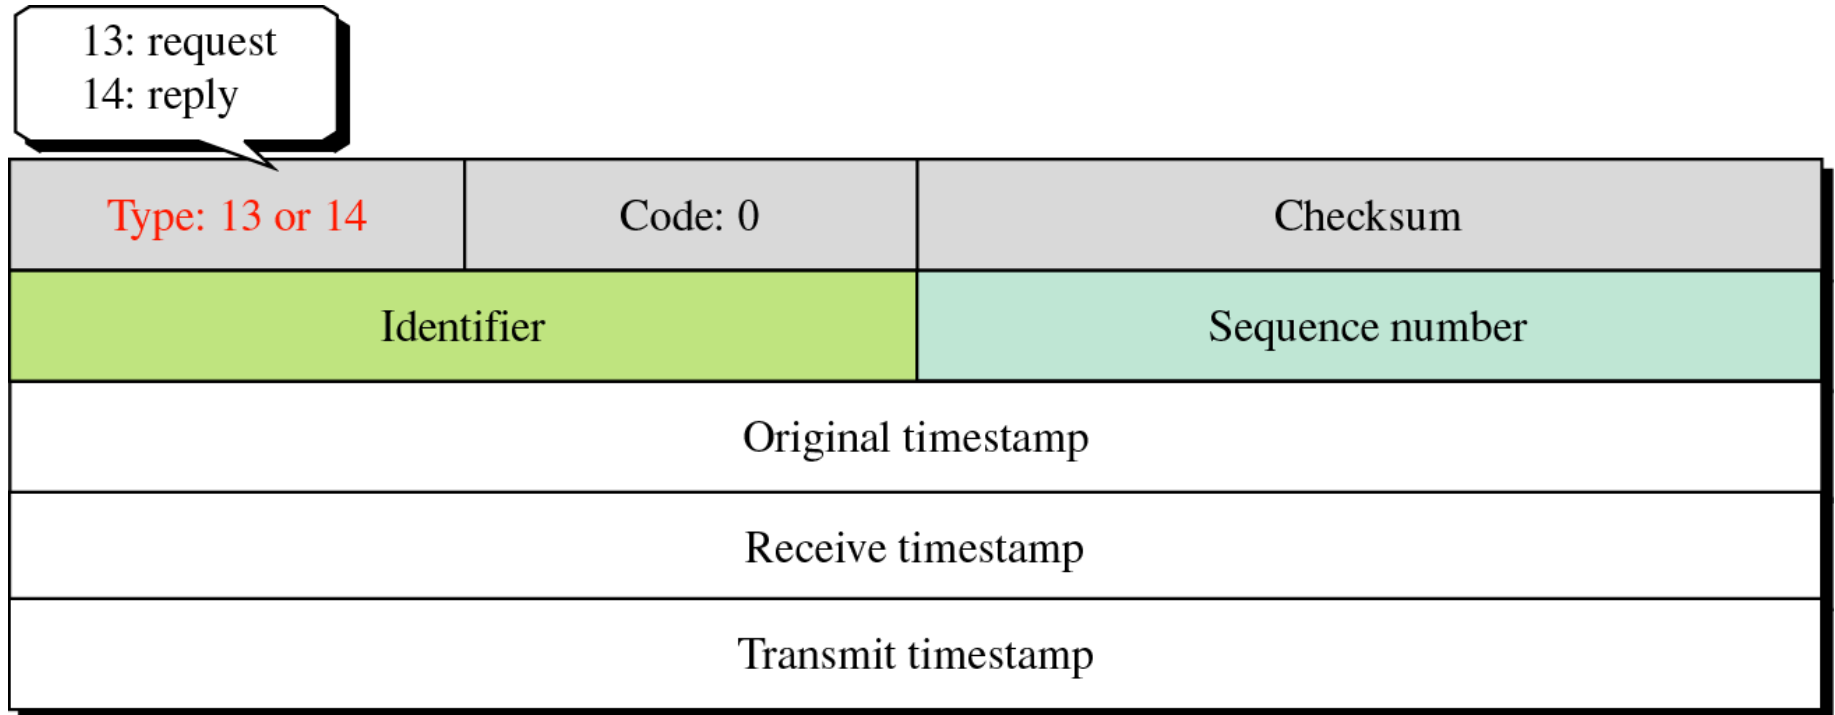

Echo-request and echo-reply message format

Ping command can use
theses messages.

Figure 9-15

Timestamp-request and timestamp-reply message format

$\text{Sending time} = \text{value of receive timestamp} -$
 $\text{value of original timestamp}$

$\text{Receiving time} = \text{time the packet returned} -$
 $\text{value of transmit timestamp}$

$\text{Round-trip time} = \text{sending time} +$
 receiving time

Note

Timestamp-request and timestamp-reply messages can be used to calculate the round-trip time between a source and a destination machine even if their clocks are not synchronized.

Given the following information:

Value of original timestamp: 46

Value of receive timestamp: 59

Value of transmit timestamp: 60

Time the packet arrived: 67

We can calculate:

Sending time = $59 - 46 = 13$ milliseconds

Receiving time = $67 - 60 = 7$ milliseconds

Round-trip time = $13 + 7 = 20$ milliseconds

Given the actual one-way time,

Time difference = receive timestamp –
(original timestamp field
+ one-way time duration)

We have:

$$\text{Time difference} = 59 - (46 + 10) = 3$$

Note

The timestamp-request and timestamp-reply messages can be used to synchronize two clocks in two machines if the exact one-way time duration is known.

Figure 9-16

Mask-request and mask-reply message format

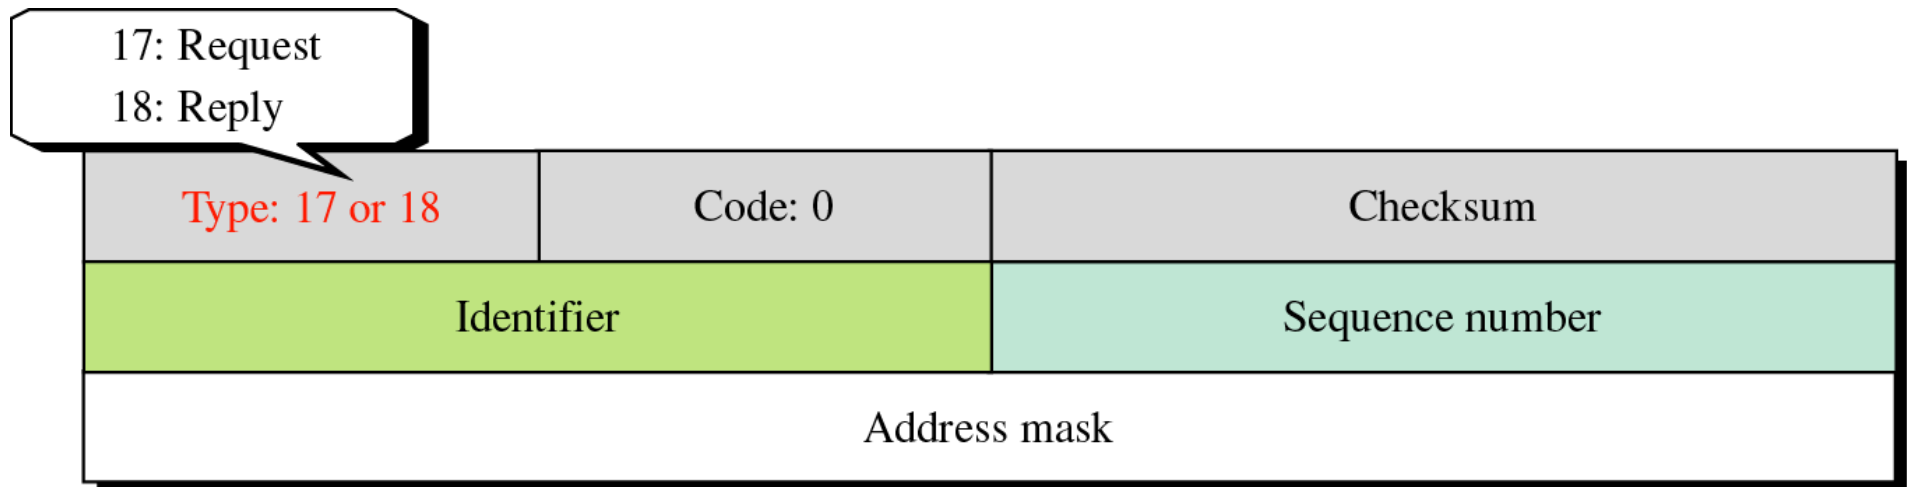

Figure 9-17

Router solicitation message format

Type: 10	Code: 0	Checksum
Identifier		Sequence number

Figure 9-18

Router advertisement message format

Type: 9	Code: 0	Checksum
Number of addresses	Address entry size	Lifetime
Router address 1		
Address preference 1		
Router address 2		
Address preference 2
